1) polarizability:

The tendency of anion to get distort or polarize by cation is called as polarizability.

2) polarizing power:

The power or ability of a cation to polarize a near by anion is known as polarizing power.

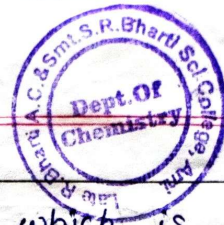

2. Study ~~map~~ why melting point of ~~calc~~ CaCl_2 is lower than NaCl ?

→ NaCl would be more effective for the melting, because calcium chloride dissociates into three ions and sodium chloride dissociates into two, so that would make the boiling point of water with calcium chloride higher. Therefore, it shouldn't be used to melt ice over sodium chloride, as it would make the water have a higher boiling point so wouldn't melt it as well!

Explanation:

That one mole of CaCl_2 is more effective in melting ice than one mole of NaCl is explained by the van't Hoff factor. The freezing point depression of a solution is calculated by

$$\Delta T = K_f b_i$$

Where k_f is a cryogenic constant which is specific to the solvent, b is the molar concentration of the solute, and i is the van't Hoff factor, which indicates number of solute particles. In this case it is the number of ions produced upon dissociation. Because k_f and b are constant and $i=3$ for $\text{CaCl}_2 \rightarrow \text{Ca}^{2+} + 2\text{Cl}^-$ and $i=2$ for $\text{NaCl} \rightarrow \text{Na}^+ + \text{Cl}^-$ the freezing point depression is greater for CaCl_2 .

The reason CaCl_2 is widely used as a melting agent may have more to do with keeping the concrete intact. Concrete is composed for many calcium-containing species. When water flows over the concrete, the calcium can be leached out, and the concrete becomes brittle. The higher the calcium content in the water, the less leaching occurs, and the concrete remains structurally sound.

3. Explain structure of NH_4^+ ion?

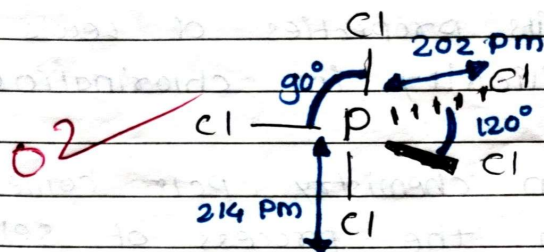

→ The central N atom undergoes sp^3 hybridization. The three half-filled sp^3 hybrid orbitals of N atom overlap axially with half-filled $1s$ orbitals of each of the 3H atoms to form 3 N-H sigma covalent bond.

• While one lone pair of N is donated to fourth H^+ ion and forms fourth co-ordinate covalent bond in NH_4^+ ion.

o/ • But here H^+ ions has an empty $1s$ orbital which overlaps with one filled sp^3 hybrid orbital of nitrogen containing lone pair of electron & forms co-ordinate covalent bond in NH_4^+ ion.

- NH_4^+ ion has tetrahedral shape with $\text{H}-\text{N}$ bond angle equal to $109^\circ 28'$.

4. Explain structure of PCl_5 ion?

Phosphorus pentachloride or PCl_5 is a compound formed by chemical elements phosphorus (Atomic number 15, symbol: P) and chlorine (Atomic number 17, symbol: Cl).

A Phosphorus pentachloride molecule consists of 1 atom of phosphorus for 5 atoms of chlorine.

If we talk about the physical appearance of the compound, it is sensitive to water and moisture in its solid form, along with being colorless.

While it being colorless, there have come to exist commercial specimen green and yellow in color upon being contaminated by Hydrogen chloride (HCl).

It is also found in its liquid and gaseous state where in it depicts neutral properties when in solid form, it has a crystalline salt-like formation and an irritating odor.

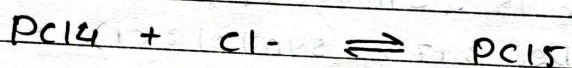

According to the mass action law phosphorus pentachloride gasifies almost devoid of any separation of phosphorus trichloride or of chlorine gas in the atmosphere.

PCl_5 has a molecular weight of 208.24 grams per mol. its boiling point is higher than that of water at 166.8-degree celsius while its melting point is as high as 160.5 - degrees celsius.

It also exhibits properties of Lewis acidity due to its familiarity for chlorination hydrolysis, etc.

In chemistry, PCl_5 comes into existence through the process of self ionization. its chemical equations of equilibrium are as follows:

Lewis structure of PCl_5 :

Lewis structure of a compound is the arrangement of its underlying atom's valence shell electrons.

Lewis structures make the use of dots to represent electrons and bonds between different electrons are represented through a straight line, marked at the end of which is a set of electrons.

The ultimate purpose of designing a Lewis structure is to assess and come to the formation of a configuration that holds the foremost arrangement of electrons and therefore equilibrium.

This must be done while considering the relevance of the octet rule and the concepts of formal charges. The Lewis structure of a compound does not deal with the 3-dimensional representation of its elements in space.

Drawing the Lewis structure of PCl_5

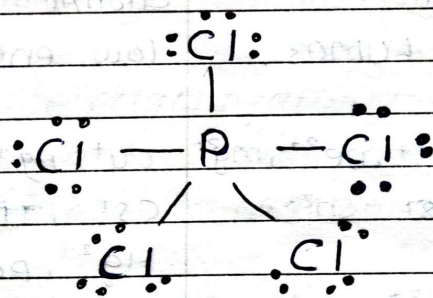

Step 1: Count the number of valence electrons in a PCl_5 molecule. We can refer to the periodic table for this. We come to understand that PCl_5 is made up of Phosphorous and Chlorine.

Step 2: To attain stability, each of the 5 chlorine atoms will form a bond with Phosphorous.

Step 3: Phosphorus lends its 5 valence shell electrons one to each of the chlorine atoms.

Step 4: Next task is to check if the atoms are stable. While chlorine atoms have received that one needed electron, phosphorus's valency is 3.

Step 5: Visualizing the diagram we come up with a phosphorus in the center, housed by 5 chlorine atoms.

Hybridization of PCl_5

The first and foremost understanding of VSEPR theory and hybridization is the need for a compound to be stable and in equilibrium.

This concept states that orbitals of atoms that have equal or similar energy can fuse with each other thereby giving rise to new, degenerate orbitals hybrid in nature.

5) write short notes on HSAB principle

Hard and soft Acids and bases (HSAB) Theory is a qualitative concept introduced by Ralph Pearson to explain the stability of metal complexes and the mechanisms of their reactions. However it is possible to quantify this concept based on Klopman's FMO analysis using interactions between HOMO and LUMO.

According to this theory the Lewis acid and bases can be further divided into hard or soft or border line types.

Hard Acids	Soft Acids
small ionic radii, High positive charge. Strongly solvated. Empty orbitals in the valence shell High energy LUMOs.	Large ionic radii Low positive charge completely filled atomic orbitals. low energy LUMOs
H^+ , Li^+ , Na^+ , K^+ , Be^{2+} , Mg^{2+} Ca^{2+} , Sc^{2+} , Sn^{2+}	Cu^+ , Ag^+ , Au^+ , Hg^+ , Cs^+ , Hg^+ Hg^{2+} , Pd^{2+} , Cd^{2+} , Pt^{2+}
Al^{3+} , Ga^{3+} , In^{3+} , Cr^{3+} , Co^{3+} Fe^{3+} , La^{3+} , Si^{4+} , Ti^{4+} , Zr^{4+} , Th^{4+}	

Hard bases	Soft bases
Small ionic radii, highly electronegative, weakly polarizable, strongly solvated, high energy LUMOs.	Large ionic radii, intermediate electronegativity, highly polarizable, low energy LUMOs.
H_2O , OH^- , F^- , Cl^- , $CH_3CO_2^-$, PO_4^{3-} , SO_4^{2-} , CO_3^{2-} , NO_3^- , ClO_4^- , ROH , RO^- , R_2O , NH_3	RS^- , R_2S , I^- , CN^- , SCN^- , $S_2O_3^{2-}$, R_3P , R_3As , $(RO)_3$, P , RNC , CO_2 , C_2H_4 , C_6H_6 , R_2O , CH_3

HSAB principle: According to HSAB concept

- Hard acids prefer binding to the hard bases to give ionic complexes whereas.
- Soft acids prefer binding to soft bases to give covalent complexes.

The large electronegativity difference between hard acids and hard bases give rise to strong ionic interactions.

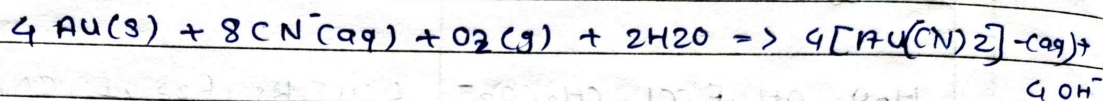

The electronegativities of soft acids and soft bases are almost same and hence have less ionic interaction i.e. the interactions between them are more covalent.

The interactions between hard acid-soft base or soft acid-hard base are mostly polar covalent and tend to be more reactive or less stable. The polar covalent compounds readily form either more ionic or more covalent compounds if they are allowed to react.

Application of HSAB principle

1. Recovery of Au:

The softest metal ion $\text{Au}^+(\text{aq})$ is recovered in mining operation by suspending it in a dilute solution of CN^- , which dissolves the Au.

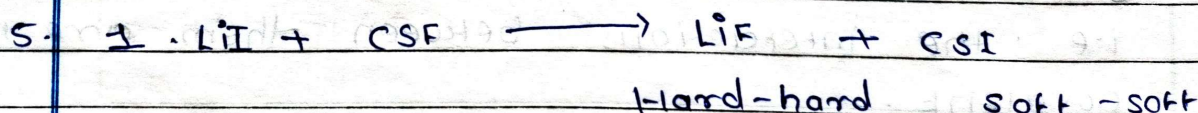

2. AgI is a soft acid base combination, while LiI is hard soft.

- The interaction between Li^+ and I^- ions is not strong.
- $\text{AgI(s)} + \text{H}_2\text{O(l)} \Rightarrow$ essentially no reaction.
- $\text{LiI(s)} + \text{H}_2\text{O(l)} \rightarrow \text{Li}^+(\text{aq}) + \text{I}^-(\text{aq})$

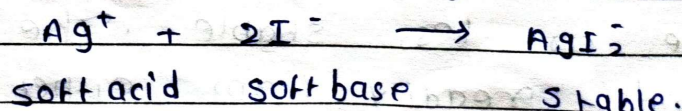

3. The strong hydrogen bond is possible in case of H_2O , NH_3 and HF since the donor atoms (R, O, & N) are HARD Bases and their interaction with partially positively charged H, which is a HARD Acid are stronger.

4. The softer acid like Ag^+ , Hg^+ , Hg^{2+} etc, and borderline acid like Fe^{2+} , Ni^{2+} , Cu^{2+} , Zn^{2+} , Pb^{2+} etc, can be precipitated as sulfides from their aqueous solution since S^{2-} ion is a softer base.

OP CuS , HgS , NiS , FeS , ZnS , PbS etc.

2. AgI^{2-} is stable but AgF^{2-} is unstable.

Ques 6. Write down electronic configuration of nitrogen family?

Ques 7. Explain Born Haber cycle.

Born Haber process or more commonly referred to as Born Haber cycle is a method that allow us to observe and analyze energies in a reaction. It mainly helps in describing the formation of ionic compounds from different elements. the methodology further enables us to understand the overall reaction process through a series of steps.

Born - Haber cycle was introduced in the year 1919 by German scientists named Fritz Haber. and max. Born. Born Haber cycle is mainly used to calculate the lattice energy. it also involves several steps or processes such as electron affinity, ionization energy, sublimation energy, the heat of formation and dissociation energy.

Considerations:

The reaction of electropositive metals with electronegative nonmetals produces ionic solids. Alkali and Alkaline earth metals react with chalcogen or halogen family elements to form compounds which are crystalline ionic solids. Ionic compounds being stabilized by the electrostatic force of attraction between positive and negative charges are expected to have similar physical properties.

But physical properties like stability, the water solubility of these ionic compounds differ much. The difference is attributed to the difference in an enthalpy called Lattice energy; between the ionic solids.

Lattice energy is the energy that keeps together the cations and anions of the compound in fixed positions in a crystalline solid state. Lattice energy can be defined as either energy released when gaseous ions form one mole of a solid ionic compound or as the energy required to convert one mole ionic solid into its gaseous ions. There is no way to measure experimentally this lattice energy. Hess law of heat summation is the only indirect way of estimating the lattice energy. Application of Hess law of heat summation to the formation of solid ionic compound involves enthalpy of all processes that are necessary for the formation of the solid ionic compound from the elemental state of the constituent atoms in a thermodynamic cycle such that the total energy summation is zero.

What is Born Haber cycle?

Born Haber cycle is a cycle of enthalpy change of process that leads to the formation of a solid crystalline ionic compound from the elemental atoms in their standard state and of the enthalpy of formation of the solid compound such that the net enthalpy becomes zero.

Born Haber cycle Examples:

Example 1: Born Haber cycle of sodium chloride NaCl, (or any AB-type mono-valent ionic solid.)

The heat of formation of sodium chloride (ΔH_f°) from the sodium metal and chlorine gas can be experimentally measured.

$$\frac{1}{2}$$

The formation of ionic solid sodium chloride from solid sodium metal and gaseous chlorine is not a single step process but goes through several processes. Heat changes of all the processes except the lattice energy can be experimentally measured.

The processes or steps in the formation of sodium chloride are.

1) solid sodium atom sublimates to gaseous atom by absorbing heat energy (ΔH_{sub})

Sublimation energy $\Delta H_{\text{sub}} = +107 \text{ kJ/mol}$.

Gaseous sodium atom absorbs the ionization energy to release one electron and forms gaseous sodium ion.

ionization energy $\Delta H_{IE} = +502 \text{ kJ/mol}$

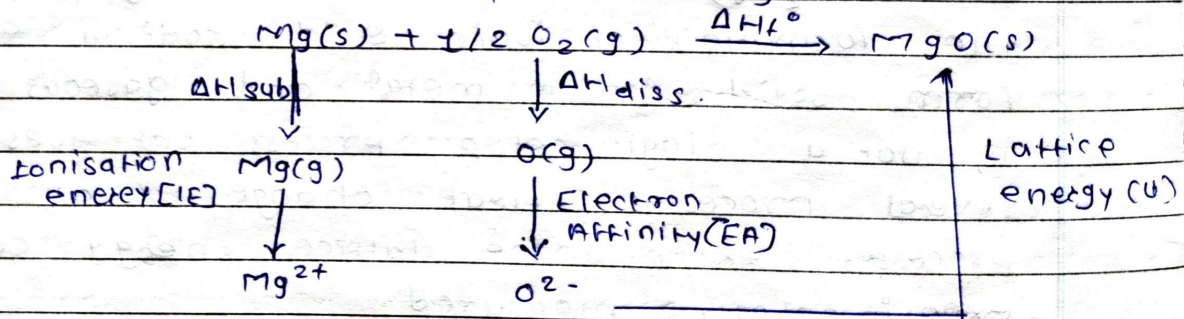

3) diatomic gaseous chlorine breaks into two individual atoms by absorbing bond energy such that each chlorine atom absorbs half of the bond energy of chlorine molecule.

$\frac{1}{2}$ Bond dissociation energy of chlorine.

$$\frac{1}{2} \Delta H_{\text{diss}} = 242 = +121 \text{ kJ/mol}$$

4) Born Haber cycle for magnesium oxide.

$$\Delta H_f^\circ = \Delta H_{\text{sub}} + IE + \Delta H_{\text{diss}} + EA + U$$

$$\text{So, } \Delta H_f^\circ = \Delta H_{\text{sub}} + \Delta H_{IE} + \frac{1}{2}$$

$$\Delta H_{\text{dis}} + \Delta H_{EA} + U \text{ or } \Delta H_f^\circ - (\Delta H_{\text{sub}} + \Delta H_{IE} +$$

$$\Delta H_{\text{dis}} + \Delta H_{EA} + U) = 0$$

$$602 + 136 + 2188 + 249 + 656 + U = 0$$

Here except lattice energy, all other enthalpies can be experimentally measured

lattice energy of the magnesium oxide solid = U =

$$\Delta H_f^\circ - (\Delta H_{\text{sub}} + \Delta H_{IE} + \frac{1}{2} \Delta H_{\text{dis}} + \Delta H_{EA})$$

ues 8 Explain structure of XeO_4 .

Xenon tetroxide appears as a yellow crystalline solid with the molecular formula XeO_4 . The temperature above -36°C , it is more prone to explode and scatter into elemental xenon and oxygen.

In this tutorial, we will discuss xenon tetroxide (XeO_4) lewis structure, molecular geometry, hybridization, polar or nonpolar etc. Xenon tetroxide is a powerful explosive. At temperatures above -35.9°C its boiling point is 0°C and its melting point is -35.9°C .

Name of molecule	xenon tetroxide
chemical formula.	XeO_4
Molecular geometry of XeO_4	Tetrahedral
Electron geometry of XeO_4	Tetrahedral
Hybridization	sp^3
Nature.	Nonpolar molecule.

XeO_4 lewis structure is made up of one xenon and four oxygen atom, the xenon is in a central position, and all oxygen is at the surrounding position. There are four double bonds ($\text{Xe}=\text{O}$) present in the XeO_4 lewis structure.

The lewis structure of XeO_4 contains 8 pairs of nonbonding electrons and 8 pairs of bonding electrons.

1. Count total valence electron in XeO_4 .

First of all, determine the valence electron that is available for drawing the Lewis structure of XeO_4 . To determine the valence electron, look at the group number of atoms in the periodic table.

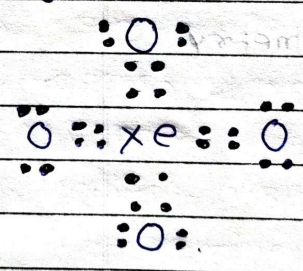

The xenon atom belongs to group 18th in the periodic table and oxygen is situated in the 16th group, hence, the valence electron for xenon is 8 and for the oxygen atom, it is 6.

$\Rightarrow$ Total number of the valence electrons in xenon = 8

$\Rightarrow$ Total number of the valence electrons in oxygen = 6.

Total number of valence electrons available for the XeO_4 Lewis structure = $8 + 6(4) = 32$ valence electrons.

[$\therefore$ XeO_4 molecule has one xenon and four oxygen atoms]

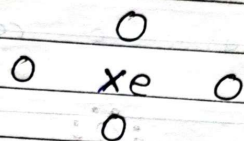

2. Find the least electronegative atom and place it at center.

An atom with a less electronegative value is more preferable for the central position in the Lewis diagram because they are more prone to share the electrons with surrounding atoms.

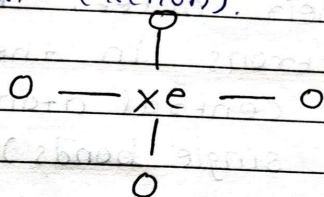

In the case of the XeO_4 molecule, the electronegativity for the xenon atom is 2.6 and for the oxygen atom, it is 3.44.

Therefore, place the xenon atom at the central position and all oxygen atoms at the surrounding position

- 3) Connect outer atoms to central atom with a single bond.

In this step, place the single bond in between the outer atoms (oxygen) and central atom (xenon).

After connecting each outer atom to the central atom, count the number of valence electrons used in the above structure. There are 4 single bonds used in the above structure, and one single bond means 2 electrons.

Hence, in the above structure, $(4 \times 2) = 8$ valence electrons are used from a total of 32 valence electrons available. For drawing the XeO_4 Lewis structure.

$$\therefore (32 - 8) = 24 \text{ valence electrons}$$

So, we are left with 24 valence electrons more.

4. Place remaining electrons on outer atoms and complete their octet.

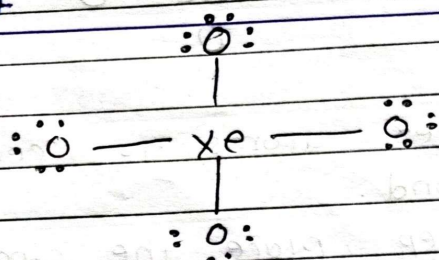

Let's start putting the remaining valence electrons on outer atoms first. In the case of the XeO_4 molecule, oxygen is the outer atom and it needs 8 electrons in the valence shell to complete the octet.

Ques. Define

1. Polarizability :-

The tendency of anion to get distorted or polarize by cation is called as polarizability

So, all oxygen atoms in the above structure completed their octet, because all of them have 8 electrons in their valence shell.

Also the central atom xenon has also 8 electrons (4 single bonds) in its valence shell.

Now again count the number of valence electrons used in the above structure.

In the above structure, there are 24 electrons represented as dots + 4 single bonds means 8 electrons.

Hence, $(24 + 8) = 32$ total electrons are used in the above structure and we had a total of 32 valence electrons available for the XeO_4 Lewis structure.

Now we have to determine the formal charge for the above structure to check whether it is stable or not.

5. The lesser the formal charge on atoms, the better is the stability of the Lewis diagram.

=> Formal charge = (valence electrons - lone pair electrons - $\frac{1}{2}$ bonding electrons)

Let's count the formal charge on the oxygen atom first, all oxygen atoms in the XeO_4 Lewis structure (4th step) have the same bonded pair and lone pair, so, just count the F.C. for the one oxygen atom.

INDUCED MUTATION: A PROMISING WAY TO PRODUCE GENETICALLY MODIFIED CROP

U. A. More

S. M. D. Bharti Art, Commerce and Science College, Arni

Mutation breeding:

Mutation breeding is one of the conventional breeding methods in plant breeding programme. Transformation breeding is being used for the first time by Hugo de Vries (1903). Transformation breeding has become increasingly popular in recent times as an effective tool for crop improvement (Basu *et al.*, 2008). Mutation techniques are the best method to expand the genetic variability of a species within a short time and have played a significant role in development of many crop varieties. Mutagenesis is used to induce genetic variability in a great number of crops because of some reasons such as – it is simple, relatively cheap to perform, applicable to all plant species and equally useful on small and large scale (Swaminathan, 1995; Siddiqui and Khan, 1999). Essential three phases of mutation breeding are generation of genetic variability, selection of useful genotypes and comparative tests to demonstrate superiority of selected genotypes. Mutation induction is an effective tool for correcting the genetic variation available to plant breeders, especially for traits with extremely low levels of genetic diversity (Szarejko and Forster, 2007).

Induced mutations in crop plants:

Mutations are sudden, permanent, and inherited changes in an organism that are usually structural changes in a gene. It is produced by a change in the original order of the genes and can be spontaneously or artificially induced. Mutation can be induced by using different chemical and physical mutagens. Induced mutation has recently become the subject of biotechnology and molecular investigations leading to explanation of the structure and function of related genes.

Induced mutagenesis has become a proven way to diversify crops. It offers the potential to induce desired traits that are either not found in nature or lost during evolution. When no gene, or gene, for specific disease resistance, or stress tolerance, can be found in the available gene pool, plant breeders have no clear option but to try mutation induction (Singh and Verma, 2015). Induced mutations are generally used for genetic improvement for qualitative and quantitative traits in the plants (Konzaket *et al.*, 1965,

Current Status and Proposed Norms, Standards for School Libraries

Dr. Shashikant Vasantrao Wankhade

Rajkamalji Bharti Arts, Commerce & Smt Sushilabai Bharti Science College, Arni, Dist. Yavatmal

Abstract

Our education commissions and Committees have given us a wakeup call by inviting our attention and concern towards the lacunas of our school education system. These lacunas reveal that the pitiable condition of school libraries badly affects reading, writing and natural understanding ability of our students. Annual Status of Education Report reveals the fact that '50% students in government schools could not read textbook of lower class and even could not write their name properly being in school for 4-5 years'. The root of this precarious condition lies in the lack of reading material, absence of reading practice and absence of such facilities. One of the principal reasons for non development of school libraries is that, there is no written policy regarding libraries. Similarly, norms and standards regarding space for library, physical facilities, book selection policy, and appointment of qualified librarian have not been fixed. As such, there is a need to evolve some benchmark for efficient school libraries. So a formulated draft of library development has been prepared wherein norms and standards of the things mentioned above have been fixed. It is hoped that this paper for School library development would prove useful.

Introduction

As school education comes under the purview of the State Government, it is essential to take planned steps at the government level for uniform development of school libraries. It is highly essential to draft, at first, School Library Policy for achieving the objectives of school libraries and ensuring their phased development. Neither the Standard School Code nor the School Education Department has set out any clear policy either in respect of the goals to be achieved by school libraries or in respect of the expectations they should meet. The library policy should be unambiguous, clear and in a written form. Similarly, it should be in coherence with the aims and policies and priorities of schools and developmental schemes. While drafting a planned policy for school library development, it is essential to fix the norms and standards. At present, in the absence of any norms and standards, there is no uniformity in the functioning of school libraries across the state. Due to this, school libraries have been neglected a lot. While recommending the Norms and Standards for school libraries here, a study of the current status of school libraries, the improvements required to be made at government and local levels and the alternatives available has been done.

Key Words : School Library, Current Status, Proposed Norms, Standards.
